Traditional Persian
Medicine

ABSTRACT

Background: Barberry (*Berberis* L.) is a well-known fruit traditionally used in various ethnomedical systems, including Ayurveda and Traditional Persian Medicine (TPM), for its nutritional and therapeutic properties. **Objective:** This study aims to provide a comprehensive overview of the traditional medicinal uses, phytochemical composition, and pharmacological effects of barberry. **Method:** A systematic review was conducted by examining traditional Persian medicine texts and electronic literature on traditional medicine. Additionally, electronic databases were searched for scholarly articles focusing on the pharmacological activities and phytochemical components of barberry. **Results:** Phytochemical analysis revealed the presence of essential oils, micronutrients, macronutrients, phytosterols, and various phenolic compounds. Pharmacological studies demonstrate that barberry possesses diverse biological activities, including anti-cancer, antioxidant, cardiometabolic protective, antimicrobial, hepatoprotective, anti-inflammatory, anxiolytic, nootropic, and neuroprotective effects. **Conclusion:** Although barberry shows promising therapeutic potential, further clinical trials and meta-analyses are required to confirm its efficacy in medical applications.

1. Introduction

Nutraceuticals are described as foods or food components that possess medicinal effects and can significantly contribute to promoting health, preventing disease, or aiding in treatment. In recent decades, these compounds have garnered considerable attention due to their safety, nutritional value, and therapeutic potential [1] Nutraceuticals can be classified according to

their chemical compositions, which include terpenoids, phenolic compounds, fatty acids and structural lipids, carbohydrates, amino acid-based substances, and minerals [2] Fruits, considered as nutraceuticals, are nutritious and health-promoting foods widely utilized for their healing effects. They have numerous beneficial components, such as proteins, carbohydrates, and fats. Additionally, fruits are rich in essential

minerals, vitamins, dietary fiber, nutrients, and antioxidants, all of which contribute to their medicinal benefits [3].

Berberis species are primarily consumed fresh or dried and are commonly used in juice production. [4] In Iran, the fruits are known as Zereshk, and frequently utilized in cooking and jam production. The substantial demand for barberries has led to an annual production of approximately 22,000 tons of fresh, edible, seedless barberries [5] These fruits are widely processed into various products, including beverages, syrups, candies, and other confectionery items that are particularly popular in Iran. Furthermore, both the leaves and fruits of barberries are utilized in manufacturing teas and food flavorings. Barberry is highly valued for its nutritional significance; not only the fruit, but also various parts of the plant, including the roots, bark, and leaves, are key components in herbal remedies within Indian, Persian, and Chinese traditional system of medicine, with a history spanning at least 3,000 years[6] Currently, the flowers of this species are widely used among Tibetan-speaking populations in regions such as Litang, China. [7].

A study was undertaken to assess the efficacy of cold-pressed filtered oil extracted from *Berberis* seeds in delaying the oxidation of soybean oil, in comparison to commercially available antioxidants. The results demonstrated that *Berberis* seed oil provided oxidative stability to soybean oil comparable to that of commercial antioxidants [8]. The antioxidant and antibacterial activities of barberry water extract suggest its potential application as a preservative in the food industry [9].

The genus *Berberis* is native to temperate and subtropical regions across Asia, Europe, Africa, North America, and South America.

Various species of *Berberis* can be found in many regions globally, including Iran. Iran is the largest producer of *Berberis* sp. fruit, with approximately 11,000 hectares of land under cultivation. The country produces over 10,000 tons of dried *Berberis* fruit annually. Within Iran, Southern Khorasan is a major producer of *Berberis* sp., with more than 97% of the cultivation occurring in Ghaenat County, Southern Khorasan Province. This region is responsible for 95% of the total *Berberis* fruit production in Iran. Different species of *Berberis* are cultivated worldwide for specific purposes, while *Berberis* sp. being particularly well-known and widely used in cooking, often prepared with rice (either seedless or red)[10].

The tree of *Berberis* is a thorny tree and its thorns are triangular. It grows at mountains and mountain slopes that are close to water, in Khorasan and Shirvan, and etc. Most of them are seedless and fresh, and in the areas of Shirvan and other areas, most of them are seeded, its stem is similar to that of jasmine, it is larger and narrower than that, its whole is whitish-yellow, its heads are complex and Its fruit is clustered and long, green in its raw state, then turns red to violet and black when ripe, it ripens in the summer, and its tree is as tall as two or three meters tall, its fruit is round. The red color is the best, in most of the compositions, it is also used in juice, paste, and extracts of the seeds, in which it is squeezed, or dried, soaked in water, rubbed and filtered [12].

Berberis spp. is known as “Zereshk” in Iran and “Ambarbaris” in TPM. It is utilized in the treatment of various conditions, including skin, liver, stomach, kidney, and eye disorders. Numerous pharmacological researches have reported beneficial effects of *Berberis*, corroborating its traditional uses.

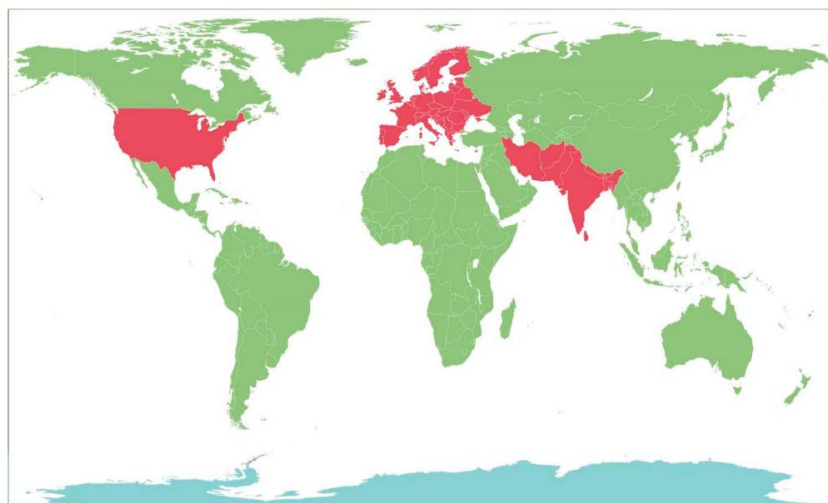

Fig. 1. The lands under cultivation of barberry in the world [11]

2. Methods

In this review, we examined prominent ancient TPM texts, including *Al-Qānūnī al-Tibb* (The Canon of Medicine) by Avicenna, *Al-Hawī fī al-Tibb* by Rhazes, and comprehensive traditional medicine pharmacopeias such as *Makhzan al-Adviah*, *Al-Shamil fī al-Tibb*, and *Tohfah al-Momenin*. We also reviewed published literature using keywords such as "Zereshk" and "Ambarbaris" to investigate the traditional uses and medicinal properties of barberry. Additionally, we searched electronic databases, including Google Scholar, PubMed, Medline, and Elsevier, for studies on the phytochemical components, pharmacological activities, and therapeutic uses of barberry. Data collection focused on review articles and clinical trial studies, with keywords including *Berberis* sp. L., berries, barberry, Persian medicine, complementary medicine, traditional medicine, and Zereshk. The results of this review are summarized and discussed in this paper.

3. Results

3.1. Pharmacological properties

The primary compounds found in *B. vulgaris* include lupeol, oleanolic acid, stigmasterol,

stigmasterolglucoside, berberamine, palmatine, berberine, oxyberberine, columbamine, isocorydine, lambertine, magniflorine, and oxycanthine. Barberry, which is rich in nutrients, contains various beneficial phytochemicals that may aid in managing diabetes, treating diarrhea, maintaining dental health, and combating acne. Additionally, it exhibits anti-cancer properties and is considered a valuable addition to the diet [13]. Research has demonstrated various effects of *Berberis* and its isoquinoline alkaloids, particularly berberine. Studies have confirmed that the primary constituents of this plant are isoquinoline alkaloids, including berberine, berbamine, and palmatine. Among these, berberine is one of the most extensively studied naturally occurring protoberberine alkaloids. In addition to being found in *Berberis* (barberry), berberine is present in many other plants and is used in the treatment of various diseases [14].

3.2. Modern phytotherapy

Berberine demonstrates significant therapeutic effects on five metabolic diseases: diabetes, obesity, non-alcoholic fatty liver disease (NAFLD), hyperlipidemia, and gout

[15]. The effect of *Berberis* on glycemic index is proven. It can decrease insulin levels [16] A pooled analysis indicated that *B. vulgaris* L. had significant effects on various metabolic indices, including total cholesterol (TC), triglycerides (TG), low-density lipoprotein (LDL), high-density lipoprotein (HDL), fasting blood sugar (FBS), alanine aminotransferase (ALT), and aspartate aminotransferase (AST) in patients. Reviews revealed a strong correlation between barberry consumption and decreased serum LDL-C levels in the intervention group compared to the control. *Berberis* markedly lowered serum levels of TC and TG, with patients treated with barberry exhibiting notably reduce serum TG levels compared to those receiving a placebo. Additionally, barberry demonstrated therapeutic effects on serum HDL-C levels in patients with metabolic syndrome. Systematic reviews have substantiated the protective effects of barberry on serum fasting blood sugar levels. However, *Berberis* does not appear to have a significant impact on ALT activity, although all studies reported a reduction in serum AST activity following treatment with barberry [17] The effects of *Berberis* have been evaluated in the reviews presented in the tables below [17].

Numerous studies have demonstrated that both *Berberis* sp. and berberine possess significant anti-inflammatory, antioxidant, and immunomodulatory properties. These substances can prevent the output of pro-inflammatory cytokines, including tumor necrosis factor- α (TNF- α), interleukins 1 β (IL-1 β), 6 (IL-6), and 17 (IL-17), while simultaneously enhancing the presentation of anti-inflammatory cytokines such as interleukin-10 (IL-10) and transforming growth factor- β (TGF- β) across various cell types and tissues. Additionally, *Berberis* and berberine are

effective in combating free radicals, increasing antioxidant enzyme levels, including superoxide dismutase (SOD), catalase (CAT), and glutathione peroxidase (GPx), and reducing lipid peroxidation and DNA damage. They have been reported to exert beneficial effects across a range of inflammatory, oxidative, and immune-related conditions, including diabetes, obesity, cardiovascular diseases, neurodegenerative disorders, autoimmune diseases, allergic conditions, and infections [18] malic acid which is a substant that could be used to juvenile the skin, is present in *B. vulgaris* ingredients, also is vitamin E and vitamin C. [19] Berberine and *Berberis* root extracts have been shown to significantly reduce the total nucleic acid content in three species of *Leishmania*, suggesting their potential as effective agents for antileishmanial chemotherapy [20].

3.3. Traditional uses of barberry in TPM textbooks

In traditional Persian medicine, the root's skin of *B. vulgaris* plant is called as "*Arghis*" which is useful in treating ophthalmic disorders and gastrointestinal diseases. Research has provided compelling evidence that berberine is a promising candidate for the treatment of dry eye [22] Additionally, the root of this plant is recognized as a promising source with significant chemopreventive potential for preventing colorectal cancer, owing to its antioxidant, anti-inflammatory, and antiproliferative properties [23] *Berberis* root extract can modulate glucose metabolism and lipid profiles in patients with type 2 diabetes [24].

Studies have demonstrated that daily consumption of barberry juice for 8 weeks significantly reduces both systemic and diastolic blood pressure [25].

Berberis sp. leaf and root extracts contain potent compounds with strong antibacterial and antifungal properties, making them effective against a wide range of microorganisms. These extracts have demonstrated efficacy in combating human multi-resistant pathogens [26].

Usage of *Berberis* can decrease signs and symptoms of opiate withdrawal syndrome [27]

It is also proven that using *B. vulgaris* in adults leads to reduction of the waist – hip ratio [28].

Studies have indicated that adjunctive therapy with *Berberis* shows promise in the treatment of refractory primary sclerosing cholangitis and primary biliary cholangitis [29].

Tables of Nutritional Properties of (*Berberis* L.) Fruits are designed below [30, 31].

Table 1. Minerals of *Berberis* L.

| Minerals | Ppm (mean) | Minerals | Ppm (mean) |
|----------|------------|----------|------------|
| Ag | 41.73 | K | 12111.19 |
| Al | 16.86 | Li | 0.32 |
| As | 3.54 | Mg | 1193.30 |
| B | 56.93 | Mn | 6.54 |
| Ba | 1.42 | Na | 2569.33 |
| Bi | 0.22 | Ni | 19.98 |
| Ca | 2744.06 | P | 2715.51 |
| Co | 0.26 | Sr | 16.17 |
| Cr | 33.21 | V | 0.69 |
| Cu | 4.75 | Zn | 7.95 |
| Fe | 323.86 | | |

Table 2. Properties of *Berberis* L.

| Properties | Values |
|-----------------------------|--------|
| Moisture (%) | 71.42 |
| Soluble dry matter (%) | 19.4 |
| Reducing sugar (%) | 6.52 |
| Ascorbic acid (mg/kg) | 256.48 |
| Total phenolics (mg/100gr) | 789.32 |
| Total anthocyanin (mg/kg) | 931.05 |
| Crude protein (%) | 10.32 |
| Crude cellulose (%) | 9.42 |
| Crude energy (kcal/gr) | 69.25 |
| Crude oil (%) | 0.84 |
| Nonsoluble HCL ash (%) | 0.0018 |
| pH | 3.35 |
| Acidity (%) | 3.10 |
| Ash (%) | 1.12 |
| Alcohol-soluble extract (%) | 26.64 |

Table 3. Traditional uses of *Berberis* L. [32]

| System | Effect | Part of plant | Preparation | Country |
|-------------------------|--|------------------|------------------|----------------|
| Cardiovascular Blood | Antihypertensive | Stem bark | Decoction | France |
| | Blood rectifier | Dried root | Decoction | Iran |
| | Choleretic | Dried entire | Infusion | Iran |
| | Cholagogue | Root | Fluid extract | France |
| Gastrointestinal | Laxative | Dried root | Decoction | Iran |
| | | Dried entire | Infusion | Iran |
| | | Dried root bark | Decoction | Iran |
| | | Fruit | Decoction | Turkey |
| | Stomachic in severe diarrhea Hepatic | Fruit | Infusion | Turkey |
| | | Dried fruit-root | H2O extract-root | Iran and India |
| | Intestinal ulcers | root | Dry powder | India |
| | Indigestion associated with hepatic disorders or loss of appetite hemorrhoids | Dried root | Decoction | Iran |

Table 3. Traditional uses of *Berberis* L. [32] (Continued)

| System | Effect | Part of plant | Preparation | Country |
|-------------------------------|---|----------------------------|------------------|-------------------|
| Endocrine | Painful menstruation | fruit | Juice | Argentina |
| Immune system | Anti Inflammatory | Dried root | Decoction | Bulgaria |
| | Rheumatoid arthritis | Dried root | Decoction | Iran |
| | Anti rheumatic Gout | Flowers | Decoction | China |
| organisms | Antimicrobial | Root | Dried root | Bulgaria |
| | In typhus | Fruit | H2O extract | Iran |
| | In malaria | Dried root | Decoction | Iran |
| Central nervous system | sedative | Dried fruit and dried root | H2O extract root | Iran and Bulgaria |
| respiratory | Whooping cough | Fruit | Decoction | Turkey |
| | Cold symptoms (gargle) | Dried leaf | Infusion | Turkey |
| | Blood vomiting due to respiratory disorders | root | Dried root | India |
| skin | Irrigate wounds or in scorbutic patients | Dried leaf | Infusion | Iran |
| | Chewed by scorbutic to harden gums disinfectant | Leaf | External | Iran |
| | | Root | Decoction | Iran |
| renal | Urinary | Root | Hot H2O | India |
| | Diuretic | Root | Dried root | Iran |
| | Kidney inflammation | Root | Dried root | Bulgaria |
| | nephritis | Root | Decoction | Iran |

Table 4. Clinical trials of *Berberis* L.

| First author of clinical trial | Year | Subject | Participants | Results |
|--------------------------------|------|-----------------------------------|---|---|
| H.Emamat (25) | 2020 | 8 weeks of Barberry juice usage | 40 men and women with cardiovascular d. and hypertensions | Decrease in SBP, DBP, MAP And plasma lipids |
| T. Kermani (33) | 2020 | 3 weeks of barberry tablets usage | 60 patients with metabolic syndrome | Decrease in SBP and waist circumference and hematocrit and serum cholesterols |
| H. Emamat (34) | 2020 | 8 weeks of dried barberry usage | 84 hypertensive patients | Improvement in flow mediated dilation and decrease in inflammatory biomarkers |

Table 4. Clinical trials of *Berberis* L. (Continued)

| First author of clinical trial | Year | Subject | Participants | Results |
|--------------------------------|------|---|--|--|
| F. Dabaghzadeh (27) | 2023 | 4 weeks of barberry 'root capsules usage | 52 opiate addicts | Improvement in signs and symptoms of opiate withdrawal syndrome |
| H. Rostami (35) | 2023 | 3 months of barberry's root capsules usage | 140 patients with Schizophrenia | no significant Effect of Barberry Root (<i>Berberis</i> sp.) on the Prevention of Metabolic Syndrome Caused by Atypical Antipsychotic Drugs |
| Z. Naghibi (29) | 2021 | 3 months of additional therapy with barberry's oxymel | 30 patients with biliary diseases | Improve in serum level of AST, ALT, Total Bil, direct B. PT, INR |
| Kashkooli (17) | 2015 | 12 weeks consumption of barberry capsules | 80 patients with non-alcoholic fatty liver disease | Decrease in Triglycerides, total cholesterols, AST And ALT serum level |
| Lazavi (36) | 2018 | 8 weeks of barberry juice usage | 46 patients with type 2 diabetes | Decrease in FBS total cholesterols and triglycerides serum levels |
| Rashidi (37) | 2018 | 4 weeks of barberry root capsules consumption | 80 patients with type 2 diabetes | Decrease in FBS, ALT, AST serum levels |
| Shidfar (38) | 2012 | 12 weeks Barberry extract capsules usage | 42 patients with type 2 diabetes | Decrease in LDL, TG, TC and FBS serum level |
| Tahmasebi (24) | 2019 | 6 weeks usage of hydro alcoholic root extract | 107 patients with type 2 diabetes | Increase in HDL and decrease in FBS, Total cholesterols and LDL serum level |

4. Discussion

Berberis L. (barberry) demonstrates significant therapeutic potential, supported by both traditional Persian medicine and modern phytotherapy. Its wide range of pharmacological activities, including anti-inflammatory, antioxidant, cardiometabolic protective, and antimicrobial properties, make it a valuable functional food for promoting public health.

Safety and Side Effects: Despite its promising health benefits, the safety profile of *Berberis* sp. must be carefully considered. Studies have reported potential side effects, including gastrointestinal discomfort and possible interactions with certain medications, particularly in pregnant women and individuals with chronic conditions. Therefore, clinical

guidelines on safe dosage and long-term effects should be established [14, 39].

Traditional vs. Modern Applications: In traditional Persian medicine, barberry is consumed in forms such as decoctions, infusions, and syrups for treating liver, gastrointestinal, and cardiovascular conditions. Modern applications include standardized extracts and capsule supplements, which provide more controlled dosages and targeted therapeutic effects [23, 24].

Impact on Public Health: Barberry's anti-inflammatory, lipid-lowering, and glucose-regulating effects position it as a functional food with the potential to mitigate chronic diseases like diabetes, obesity, and cardiovascular disorders. Incorporating barberry into diets could support public health initiatives aimed at

reducing the prevalence of metabolic syndromes [17, 25].

Conclusion

Further clinical trials and meta-analyses are essential to confirm the efficacy and safety of *Berberis* sp. Standardizing extracts, determining optimal dosages, and evaluating long-term effects are crucial next steps. Moreover, research should explore barberry's potential in novel therapeutic areas and drug development [18].

In conclusion, *Berberis* sp. offers significant promise as a functional food and therapeutic agent. However, rigorous scientific validation through clinical studies is necessary to fully realize its potential in modern healthcare.
